Systems Modelling and Analysis

Choose yourself and new technologies

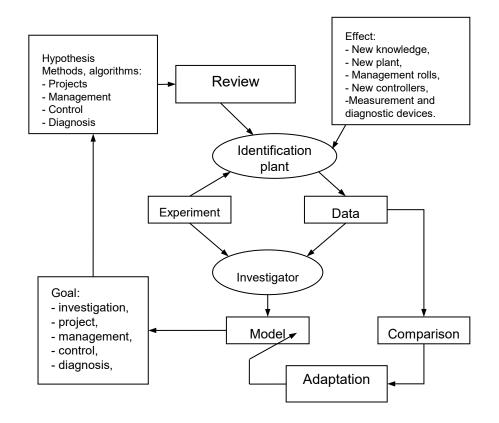

L.24 Summary

#### Model in the systems research

#### Model in the systems research

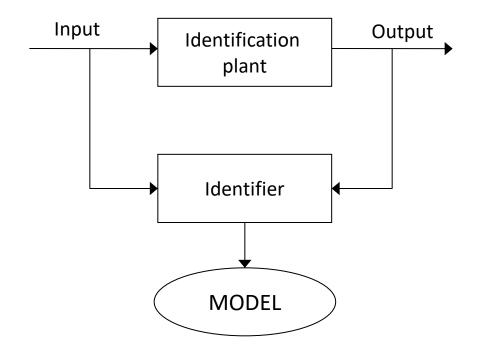

- Conceptual models
- Physical models
- Analog models
- Mathematical models
- Computer models

#### **Identification Task**

#### Identification task

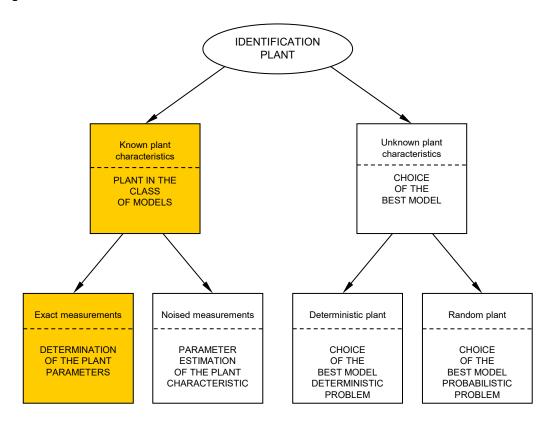

- 1. Determination of the identification plant
- Determination of the class model
- 3. Experiment organization
- Determination of the identification algorithms
- 5. Identifiers realization

### Typical identification tasks

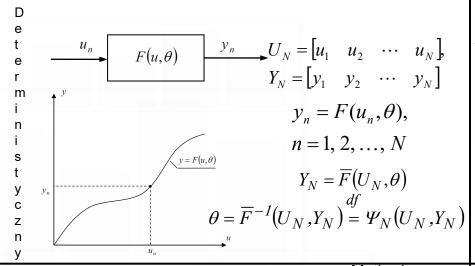

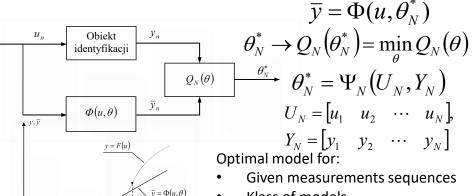

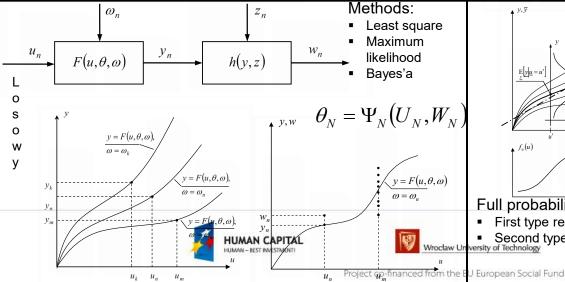

#### Plant in the class of model

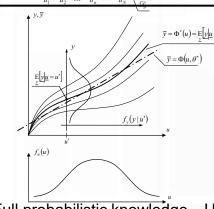

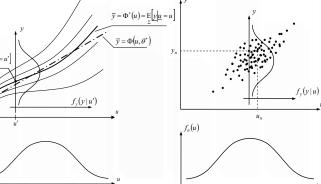

#### Choice of the best model

- Klass of models
- Given performance index

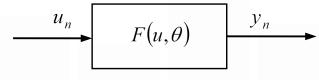

- Full probabilistic knowledge
- First type regrsesion
  - Second type regression
- Unknown probabilostic knowledge
- · Performance index estimatin arameter estimation of the probability distribution
- Probabilit ditribution estimatoin

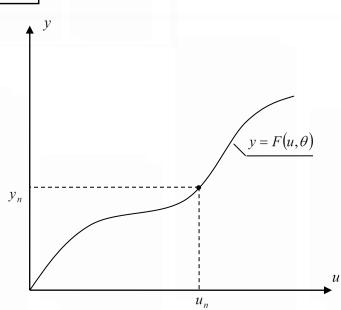

## Determination of the plant parameters (3)

#### Measurements:

$$U_N = [u_1 \quad u_2 \quad \cdots \quad u_N],$$

$$Y_N = \begin{bmatrix} y_1 & y_2 & \cdots & y_N \end{bmatrix}$$

# Determination of the plant parameters (4)

System of equations:

$$y_n = F(u_n, \theta), \quad n = 1, 2, ..., N$$

can be written

$$\begin{bmatrix} y_1 & y_2 & \cdots & y_N \end{bmatrix} = \begin{bmatrix} F(u_1, \theta) & F(u_2, \theta) & \cdots & F(u_N, \theta) \end{bmatrix}$$

For

$$[F(u_1,\theta) \quad F(u_2,\theta) \quad \cdots \quad F(u_N,\theta)] \stackrel{df}{=} \overline{F}(U_N,\theta)$$

we can rewrite given set of equations:

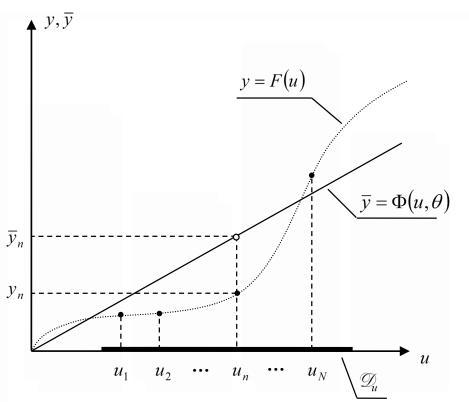

$$Y_N = \overline{F}(U_N, \theta)$$

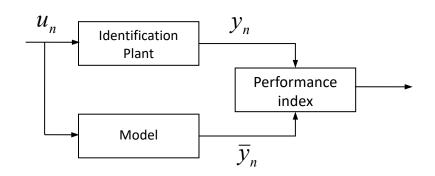

## Choice of the best model Deterministic problem

## Choice of the best model based on the noise free measurements

Problem formulation

Performance index: 
$$Q_N(\theta) = ||Y_N - \overline{Y}_N(\theta)||_{U_N}$$

where: 
$$\overline{Y}_N(\theta) = [\Phi(u_1, \theta) \quad \Phi(u_2, \theta) \quad \cdots \quad \Phi(u_N, \theta)]$$

$$Q_N(\theta) = \sum_{n=1}^N \alpha_n q(y_n, \overline{y}_n) = \sum_{n=1}^N \alpha_n q(y_n, \Phi(u_n, \theta)) \quad \text{e. g. :} \quad Q_N(\theta) = \sum_{n=1}^N |y_n - \overline{y}_n| = \sum_{n=1}^N |y_n - \Phi(u_n, \theta)|$$

$$Q_{N}(\theta) = \max_{1 \leq n \leq N} \{q(y_{n}, \overline{y}_{n})\} = \max_{1 \leq n \leq N} \{q(y_{n}, \Phi(u_{n}, \theta))\} \quad \text{e. g. : } Q_{N}(\theta) = \max_{1 \leq n \leq N} \{y_{n} - \overline{y}_{n}|\} = \max_{1 \leq n \leq N} \{y_{n} - \Phi(u_{n}, \theta)\}$$

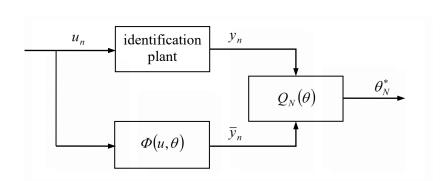

## Choice of the best model based on the noise free measurements

Problem formulation

Optimal model:  $\overline{y} = \Phi(u, \theta_N^*)$ 

$$\theta_N^* \to Q_N(\theta_N^*) = \min_{\theta} Q_N(\theta)$$

The model is optimal for:

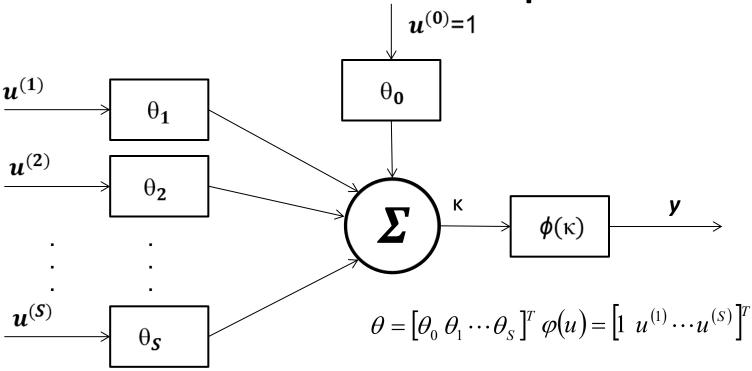

- given measurement sequence
- proposed model
- performance index

#### Neuron model simplification

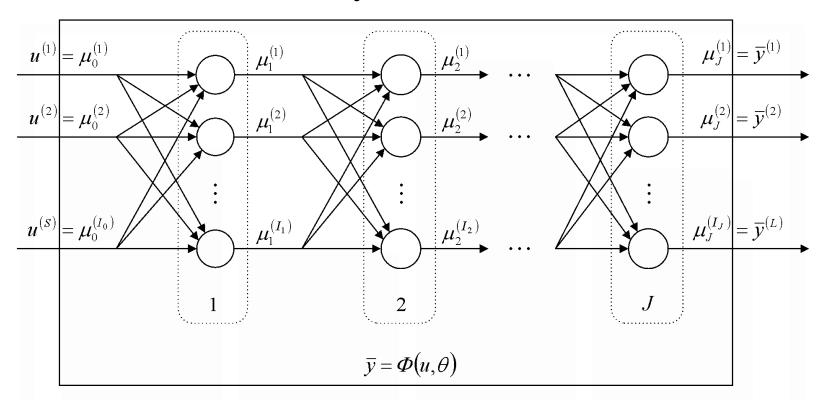

$$y = \phi \left( \sum_{s=1}^{S} \theta_s u^{(s)} + \theta_0 \right) = \phi \left( \theta^T \varphi(u) \right)$$
  $\Phi$  – activation function

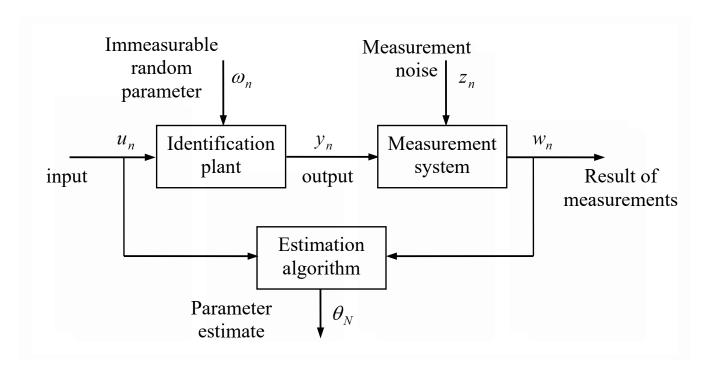

#### Multilayer network

## Plant parameter estimation problem

# Noised measurements of the physical values

Problem formulation

#### Measurement noise:

 $z_n$  — value of random variable  $\underline{z}$  from the space  $\mathscr X$ 

 $f_z(z)$  – probability density function

 $\theta$  – observed vector of parameters, value of random variable  $\underline{\theta}$ ,  $\theta \in \Theta \subseteq \mathbb{R}^R$ 

 $f_{\theta}(\theta)$  – probability density function

Measurements:  $V_N = \begin{bmatrix} v_1 & v_2 & \cdots & v_N \end{bmatrix}$ 

 $h(\theta,z)$ 

 $\Psi_{N}(V_{N})$ 

# Noised measurements of the physical values

General form of estimation algorithm:

$$\theta_N = \Psi_N(V_N)$$

- Solution:
  - Least square method
  - Maximum likelihood method
  - Bayesian method

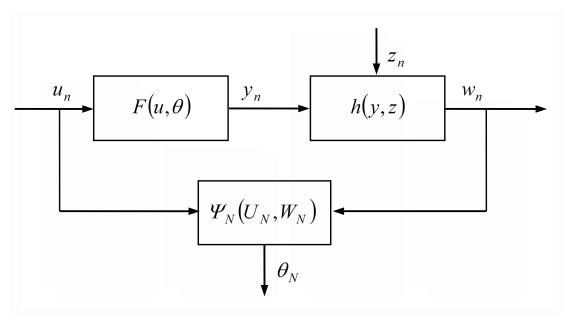

## Plant parameter estimation problem

Deterministic plant, noised measurements of the plant output

where:

$$U_N = \begin{bmatrix} u_1 & u_2 & \cdots & u_N \end{bmatrix}$$

$$W_N = \begin{bmatrix} w_1 & w_2 & \cdots & w_N \end{bmatrix}$$

 $\Psi_{_{\mathit{N}}}$  – estimation algorithm

$$\theta_{\scriptscriptstyle N}$$
 – estimate of  $\theta$ 

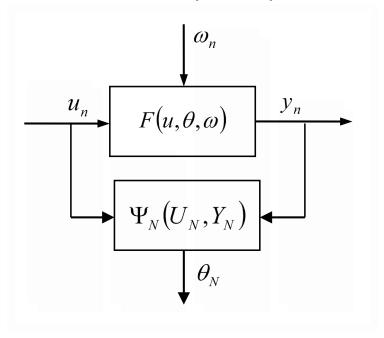

# Plant parameter estimation problem

Immeasurable random plant parameter

where:

$$U_N = \begin{bmatrix} u_1 & u_2 & \cdots & u_N \end{bmatrix}$$

$$Y_N = \begin{bmatrix} y_1 & y_2 & \cdots & y_N \end{bmatrix}$$

 $\Psi_{_{N}}$  – estimation algorithm

$$\theta_{\scriptscriptstyle N}$$
 – estimate of  $\theta$ 

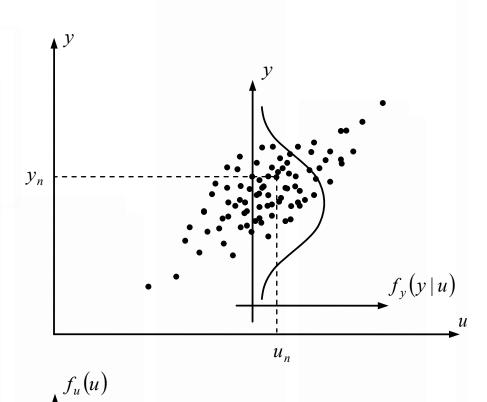

$$(u_n, y_n), n = 1, 2, ..., N$$

are values of random variables  $(\underline{u}, y)$ 

# Choice of the best model, probabilistic case

Two possible cases

#### Full a'priori knowledge

- joint probability density function f(u,y) of random variables  $(\underline{u},y)$ 

or

- conditional probability density function  $f_v(y|u)$ 

and mrginal probability density function

$$f_u(u)$$

#### Incomplete probabilistic information

joint probability density function of random variables  $(\underline{u}, \underline{y})$  exist, but is not known. Measurements:

$$(u_n, y_n), n = 1, 2, ..., N$$
  
are values of  $(\underline{u}, y)$ 

are known

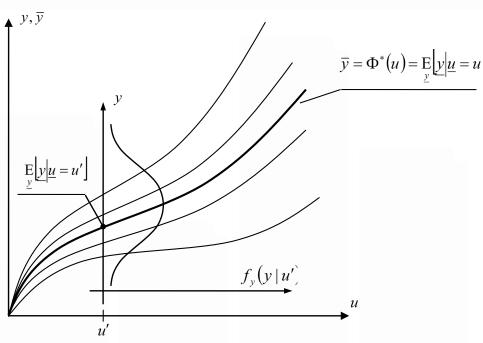

### Full a'priori knowledge

Regression of the I type

$$\overline{y} = \Phi^*(u) = E[\underline{y}|\underline{u} = u] = \int_{\mathscr{Y}} y f(y|u)dy$$

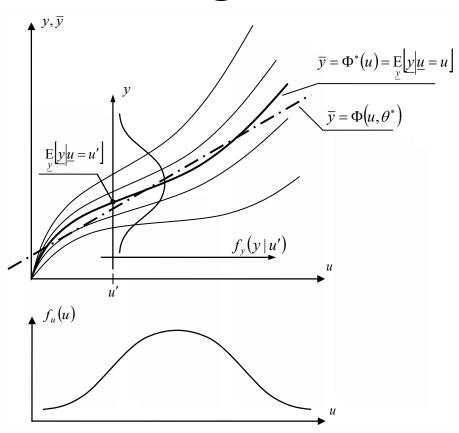

### Full a'priori knowledge

Regression of the II type

$$q(y, \overline{y}) = [y - \overline{y}]^T [y - \overline{y}]$$

$$Q(\theta) = \iint_{\mathcal{U}} [y - \Phi(u, \theta)]^T [y - \Phi(u, \theta)] \times f(u, y) dy du$$

### Full a'priori knowledge

$$Q(\theta) = \int_{\mathcal{U}} \int_{\mathcal{U}} (y - \Phi^*(u))^2 f(u, y) dy du + \int_{\mathcal{U}} (\Phi^*(u) - \Phi(u, \theta))^2 f_u(u) du$$

$$\theta^* \to \min_{\theta} Q(\theta) = \min_{\theta} \int_{\mathcal{U}} (\Phi^*(u) - \Phi(u, \theta))^2 f_u(u) du$$

the I type regression

weight function

The II type regression is the best approximation of the I type regression.

### Unknown a Priori Knowledge Empirical Estimation of the Performance Index

**Empirical Estimation of the Performance Index** 

**Empirical Probability Density Functions** 

Unknown parameters of the probability density functions

**Empirical Probability Density Functions** 

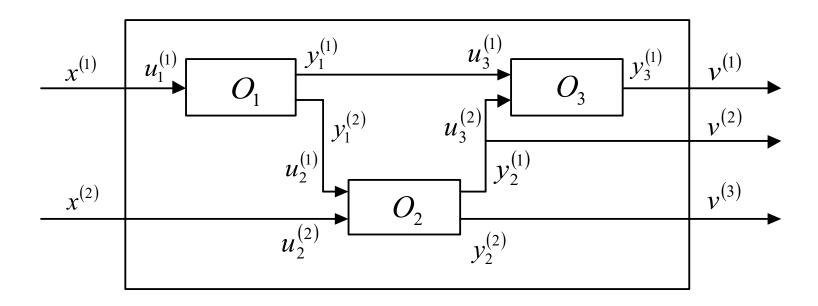

Non parametric – Parzen estimation

### Complex systems description

Example of complex system

# Complex systems identification problems

- Identification with restricted measurements posibilities
- Local and global identification
- Multistage identification
- Compleks of operation systems

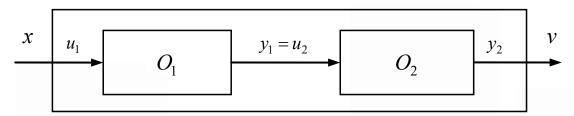

## Identification of complex systems with restricted measurement possibilities

The following examples show the problem.

Cascade structure of two elements

For the above case the system description has the form:

$$\begin{bmatrix} u_1 \\ u_2 \end{bmatrix} = \begin{bmatrix} 0 & 0 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} y_1 \\ y_2 \end{bmatrix} + \begin{bmatrix} 1 \\ 0 \end{bmatrix} x = \begin{bmatrix} x \\ y_2 \end{bmatrix},$$

$$v = \begin{bmatrix} 0 & 1 \end{bmatrix} \begin{bmatrix} y_1 \\ y_2 \end{bmatrix} = y_2.$$

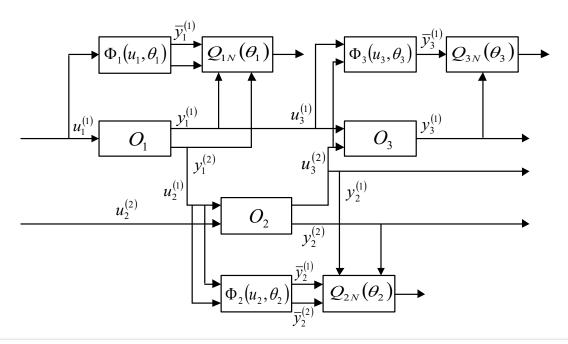

# Choice of the best model of complex system

Locally optimal model of complex system

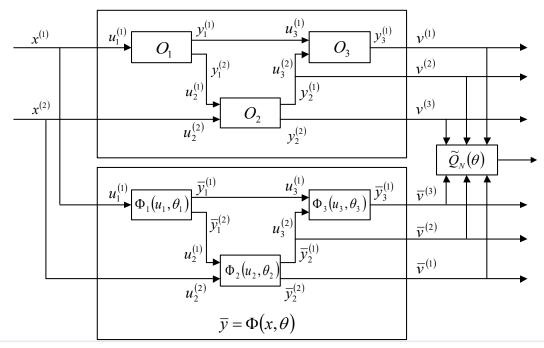

# Choice of the best model of complex system

Globally optimal model of complex system

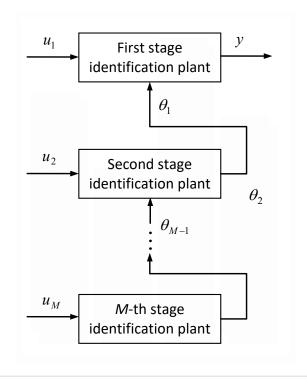

## Two stage identification and it's applications

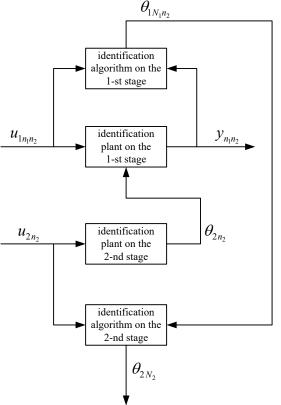

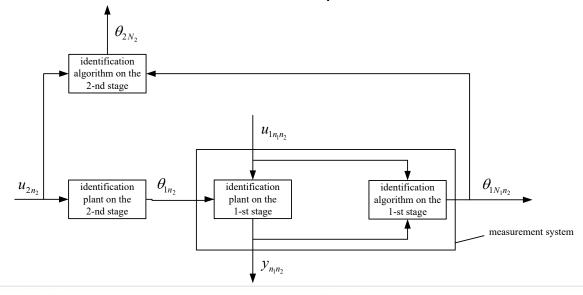

## Two stage identification and it's applications

Two stage identification

- Space decomposition
- Time decomposition

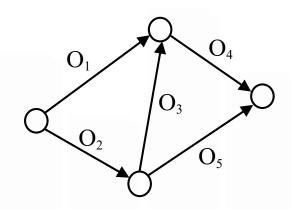

## Identification of complex of operations

$$T_m = F_m(u_m, a_m), \quad m = 1, 2, ..., M, \quad T = H(T_1, T_2, ..., T_M)$$

 $H\,$  – function determining the total runtime of complex of operation

$$F_1, F_2, \dots, F_M$$
 – known functions

 $a_1, a_2, \dots, a_M$  – unknown parameters

### Basic optimization task formulation

**Decision variables:** 
$$x = \begin{bmatrix} x^{(1)} \\ x^{(2)} \\ \vdots \\ x^{(S)} \end{bmatrix}$$

**Objective function:** y = F(x)

Set of feasible decisions (commonly defined by variables domain and constraints):

$$x \in \mathcal{D}_x$$

**Optimization task:** 
$$x^* \to F(x^*) = \min_{x^* \in \mathcal{D}_x} F(x)$$
,  $x^*$  - optimal decision 
$$\min F(x) = -\max(-F(x))$$

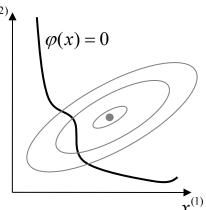

# General classification of optimization tasks

Unconstrained optimization:  $\mathcal{Q}_x = \mathcal{R}^S$ 

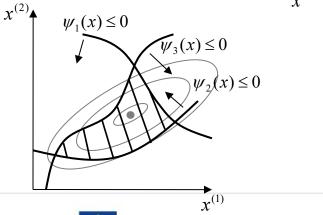

Optimization under equality constraints:

$$\mathcal{Q}_x = \left\{ x \in \mathcal{R}^S : \varphi_1(x) = 0, \varphi_2(x) = 0, \dots, \varphi_L(x) = 0, L \le S \right\}$$

Optimization under inequality constraints:

$$\mathcal{Q}_x = \left\{ x \in \mathcal{R}^S : \psi_1(x) \le 0, \psi_2(x) \le 0, \dots, \psi_M(x) \le 0 \right\}$$

### Analytical methods

- Unconstrained optimization
- Lagrange multipliers method equality constraints
- Kuhn-Tucker conditions inequality constraints

# Unconstrained optimization

Optimization task: 
$$x^* \to F(x^*) = \min_{x^* \in \mathcal{D}_x} F(x)$$

Assumption: F(x) is continuous and differentiable.

Necessary condition for  $x^*$  to be local minima:  $\nabla_x F(x^*) = 0_S$ 

If F(x) is convex function, then above equation is sufficient condition for  $x^*$  to be global minima.

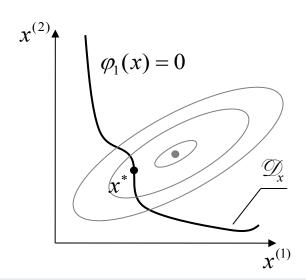

Optimization task:  $x^* \to F(x^*) = \min_{x^* \in \mathcal{Q}_x} F(x)$ 

$$\mathcal{Q}_{x} = \left\{ x \in \mathcal{R}^{S} : \varphi_{1}(x) = 0, \varphi_{2}(x) = 0, \dots, \varphi_{L}(x) = 0, L \leq S \right\}$$

The method of Lagrange multipliers

Lagrange function:

$$L(x,\lambda) = F(x) + \sum_{l=1}^{L} \lambda_l \varphi_l(x) = F(x) + \lambda^T \varphi(x)$$

Necessary conditions of optimality:

$$\left. \nabla_x L(x, \lambda) \right|_{x^*, \lambda^*} = 0_S$$

$$\nabla_{\lambda} L(x,\lambda)|_{x^* \to x^*} = 0_L$$
 If and only if

rank 
$$G(x) = \text{rank } [G(x) : -\nabla_x F(x)],$$

 $\lambda = \begin{vmatrix} \lambda_1 \\ \lambda_2 \\ \vdots \end{vmatrix}, \quad \varphi(x) = \begin{vmatrix} \varphi_1(x) \\ \varphi_2(x) \\ \vdots \\ \varphi_n(x) \end{vmatrix}$ 

Where: 
$$G(x) = [\nabla_x \varphi_1(x) : \nabla_x \varphi_2(x) : \cdots : \nabla_x \varphi_L(x)]$$

The generalized method of Lagrange multipliers

Generalized Lagrange function:

$$L(x, \lambda, \lambda_0) = \lambda_0 F(x) + \sum_{l=1}^{L} \lambda_l \varphi_l(x)$$

Necessary conditions of optimality:

$$\left. \nabla_x L(x, \lambda, \lambda_0) \right|_{x^*, \lambda^*, \lambda_0} = 0_S$$

$$\left. \nabla_{\lambda} L(x, \lambda, \lambda_0) \right|_{x^*, \lambda^*, \lambda_0} = 0_L$$

The generalized method of Lagrange multipliers

$$\nabla_x L(x,\lambda,\lambda_0) = \lambda_0 \nabla_x F(x) + \sum_{l=1}^L \lambda_l \nabla_x \varphi_l(x) = 0_S$$
 
$$1^{\text{O}} \qquad \lambda_0 \neq 0 \qquad \nabla_x F(x) + \sum_{l=1}^L \frac{\lambda_l}{\lambda_0} \nabla_x \varphi_l(x) = 0_S \\ \Rightarrow \nabla_x F(x) + \sum_{l=1}^L \lambda_l' \nabla_x \varphi_l(x) = 0_S$$
 We obtain regular solutions. 
$$2^{\text{O}} \qquad \lambda_0 = 0 \qquad \sum_{l=1}^L \lambda_l \nabla_x \varphi_l(x) = 0_S$$
 We obtain irregular solutions.

Second order condition of optimality requires analysis of  $H(x, \lambda, \lambda_0) = \nabla_{xx}^2 L(x, \lambda, \lambda_0)$ .

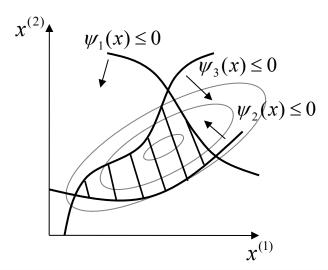

Optimization task:  $x^* \to F(x^*) = \min_{x^* \in \mathcal{Q}_x} F(x)$ 

$$\mathcal{Q}_x = \left\{ x \in \mathcal{R}^S : \psi_1(x) \le 0, \psi_2(x) \le 0, \dots, \psi_M(x) \le 0 \right\}$$

Lagrange function:

$$L(x,\mu) = F(x) + \mu^T \psi(x) \quad \Leftrightarrow \quad L(x,\mu) = F(x) + \sum_{m=1}^M \mu_m \psi_m(x) \qquad \qquad \mu = \begin{bmatrix} x & 1 \\ \mu_2 & \vdots \\ \vdots & \vdots \end{bmatrix}$$

$$\mu = egin{bmatrix} \mu_1 & \mu_2 & \vdots & \mu_M \end{bmatrix}$$

Necessary conditions of optimality:

$$\nabla_{x}L(x,\mu)\Big|_{x^{*},\mu^{*}} = 0_{S}$$

$$\mu^{T}\nabla_{\mu}L(x,\mu)\Big|_{x^{*},\mu^{*}} = 0$$

$$\nabla_{\mu}L(x,\mu)\Big|_{x^{*},\mu^{*}} \le 0_{M}$$

$$\mu^{*} \ge 0_{M}$$

If solution is regular

$$\alpha = \begin{bmatrix} \alpha_1 \\ \alpha_2 \\ \vdots \\ \alpha_S \end{bmatrix} \quad \beta = \begin{bmatrix} \beta_1 \\ \beta_2 \\ \vdots \\ \beta_S \end{bmatrix} \qquad \alpha \leq \beta \Rightarrow \forall_{s=1,\dots,S} \alpha_s \leq \beta_s$$

$$\alpha \leq \beta \Rightarrow \forall_{s=1,\dots,S} \alpha_s \leq \beta_s$$
HUMAN CAPITAL HUMAN-BEST INVESTMENT

### Optimization under inequality constraints Kuhn – Tucker rolls

**Regularity Conditions** 

- 1. Karlin: constraints  $\psi_1(x), \psi_2(x), \dots, \psi_M(x)$  linear
- 2. Slater: constraints  $\psi_1(x), \psi_2(x), \dots, \psi_M(x)$  convex functions and feasible set is not empty
- 3. Fiacco Mac Cormica: in the optimal point gradients of all active constraints are linear
- independent, i.e.:  $\forall \ m \in I(x^*) \quad \nabla_x \psi_m(x^*)_{x=x^*} \ \text{ are linear independent}$
- 4. Zangwil:  $\mathcal{D}(x^*) = \overline{D}(x^*)$
- 5. Kuhna Tucker'a: for each direction  $d \in \mathcal{D}(x^*)$  there exists regular curve starting in the point  $\chi^*$  tangent to that direction

The point 
$$x$$
 tangent to that direction  $\forall d \in \mathcal{D}(x^*) \quad \exists e(\theta), \quad \theta \in [0, 1]$ 

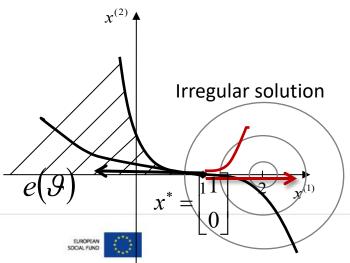

$$e(\theta) = x^* \qquad e(\theta) = \begin{bmatrix} e_1(\theta) \\ e_2(\theta) \\ \vdots \\ e_S(\theta) \end{bmatrix}$$

$$de(\theta)_1 \qquad de(\theta)_1 \qquad de(\theta)_2 \qquad de(\theta)_3 \qquad de(\theta)_4 \qquad de(\theta)_4 \qquad de(\theta)_5 \qquad de(\theta)_5$$

- $e(0) = x^*$
- $e(\mathcal{G}) \in D_{r} \quad \forall \ \mathcal{G} \in [0,1]$

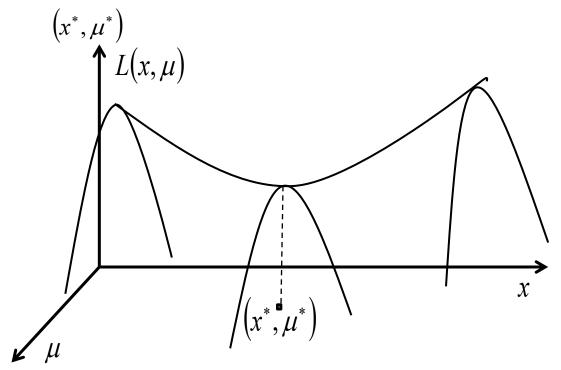

#### Saddle point

Saddle point

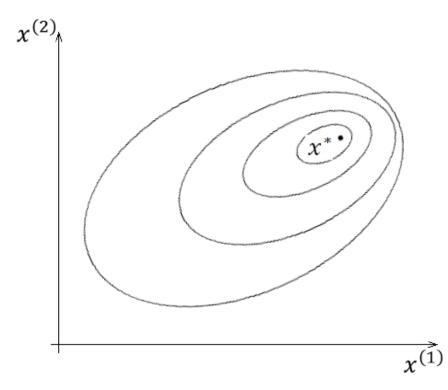

$$L(x^*, \mu^*) \le L(x, \mu^*) \quad \forall x \in \mathcal{D}(x) \subseteq \mathcal{R}^S$$
$$L(x^*, \mu) \le L(x^*, \mu^*) \qquad \forall \mu \ge 0_M$$

$$L(x^* = u^*) = \min_{x \in \mathcal{P}(x)} \max_{u \geq 0} L(x_*)$$

## Numerical optimization methods

$$x^* \to F(x^*) = \min_{x \in D_x} F(x)$$

Analytical methods has drawbacks, when:

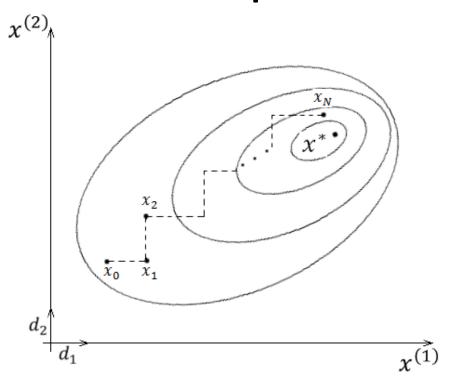

- 1. The goal function F and constraints  $\varphi, \psi$  are nonlinear.
- 2. Functions F,  $\varphi$  and  $\psi$  are non-differentiable
- 3. Mathematical formula describing functions F,  $\varphi$  and  $\psi$  is not available, it can only be "measured"
- 4. Large dimension of decision variables vector

### Numerical optimization methods

Algorithm

$$x_{n+1} = \Psi(x_n), x_0$$

- Choice of the search direction.
- Line search optimization.
- Stopping conditions.

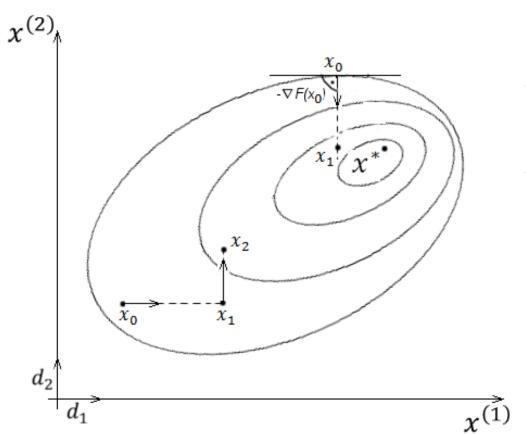

$$x_0, x_1, ..., x_n, ..., x_N \approx x^*$$
  
 $F(x_0) > F(x_1) > ... > F(x_n) > ... > F(x_N) \approx F(x^*)$ 

#### Choice of the search direction

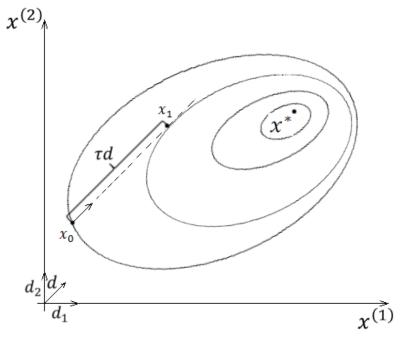

- Basis of search directions non-gradient methods.
- Search directions based on gradient vectors – gradientbased methods.

### Line search optimization

 $x_0$  – initial solution

 $x_1$  – next solution

d – search direction

 $\tau$  – step size

$$\tau^* \to F(x_0 + \tau^* d) = \min_{\tau} F(x_0 + \tau d)$$

$$x_0$$
,  $d$  – fixed

$$F(x_0 + \tau d) \triangleq f(\tau)$$

 $f(\tau)$  – a single variable function (of the step size  $\tau$ )

$$\tau^* \to f(\tau^*) = \min_{\tau} f(\tau)$$

line search optimization ≡ optimization of a single variable function

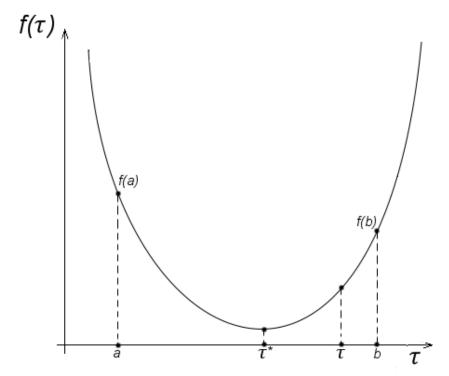

### Reducing the interval of uncertainty

Assumption:  $\tau^* \in [a, b]$ 

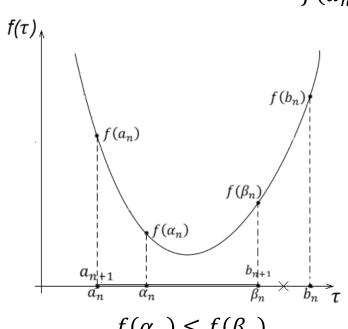

## Splitting the section into two parts

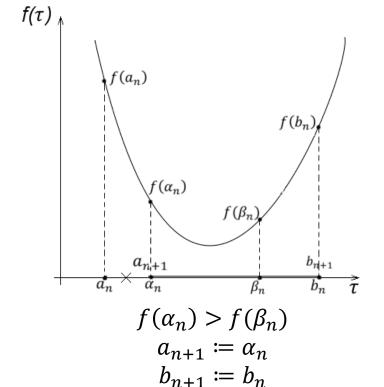

$$f(\alpha_n) \le f(\beta_n)$$

$$a_{n+1} \coloneqq a_n$$

$$b_{n+1} \coloneqq \beta_n$$

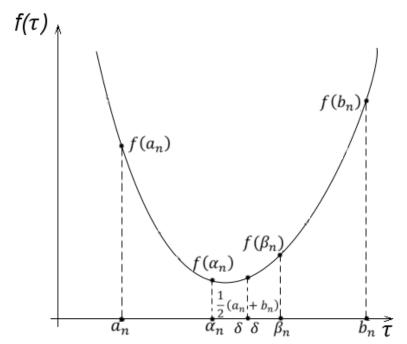

### Dichotomous search method

$$\alpha_n = \frac{1}{2}(a_n + b_n) - \delta$$

$$\beta_n = \frac{1}{2}(a_n + b_n) + \delta \qquad N = ?$$

Input data:  $a_0, b_0, \varepsilon, \delta$ 

Step 0: n = 0

Step 1:  $\alpha_n = \frac{1}{2}(a_n + b_n) - \delta$ 

$$\beta_n = \frac{1}{2}(a_n + b_n) + \delta$$

Step 2: If  $f(\alpha_n) \le f(\beta_n)$  then

$$a_{n+1} \coloneqq a_n, b_{n+1} \coloneqq \beta_n,$$

otherwise

$$a_{n+1} \coloneqq \alpha_n, b_{n+1} \coloneqq b_n.$$

Step 3: If  $|b_{n+1} - a_{n+1}| \ge \varepsilon$  then

$$n \coloneqq n + 1$$
, go to 1,

otherwise

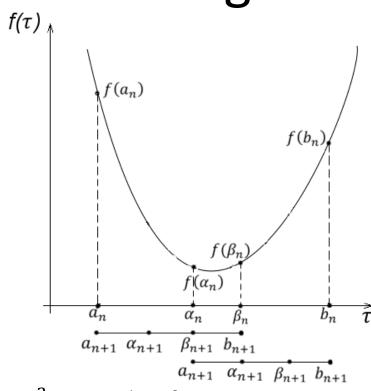

$$\tilde{\tau} = \frac{1}{2}(a_{n+1} + b_{n+1})$$
 (STOP)

# The golden section method

$$\gamma^2 + \gamma - 1 = 0$$
 $\gamma = \frac{\sqrt{5} - 1}{2} \approx 0.618$   $N = ?$ 

Input data: 
$$a_0$$
,  $b_0$ ,  $\varepsilon$ ,  $\gamma = \frac{\sqrt{5}-1}{2}$ 

Step 0: 
$$n = 0$$

$$\alpha_0 = b_0 + \gamma (a_0 - b_0)$$

$$\beta_0 = a_0 + \gamma (b_0 - a_0)$$

Step 1: If 
$$|b_n - a_n| < \varepsilon$$
, then

$$\tilde{\tau} = \frac{1}{2}(a_n + b_n)(STOP)$$

otherwise go to 2

Step 2: If 
$$f(\alpha_n) \le f(\beta_n)$$
 then

$$a_{n+1} \coloneqq a_n, b_{n+1} \coloneqq \beta_n,$$

$$\beta_{n+1} \coloneqq \alpha_n, \ \alpha_{n+1} \coloneqq \beta_n + \gamma(\alpha_n - b_n)$$

$$n := n + 1$$
, go to 1

otherwise

$$a_{n+1} \coloneqq \alpha_n, b_{n+1} \coloneqq b_n,$$

$$\alpha_{n+1} \coloneqq \beta_n, \ \beta_{n+1} \coloneqq \alpha_n + \gamma(b_n - \alpha_n)$$

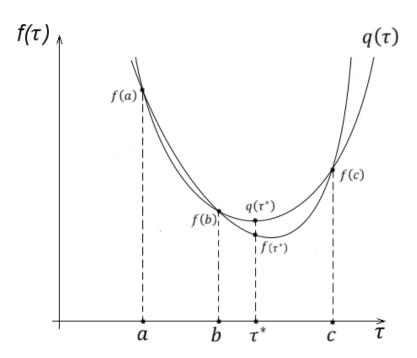

$$n \coloneqq n + 1$$
, go to 1

### Quadratic-fit line search method

$$a < b < c$$

$$f(a) \ge f(b)$$

$$f(b) \le f(c)$$

 $q(\tau)$  – quadratic-fit function  $\tau^*$  - minimum of the function  $q(\tau)$ 

$$q(\tau) = \frac{f(a)(\tau - b)(\tau - c)}{(a - b)(a - c)} + \frac{f(b)(\tau - a)(\tau - c)}{(b - a)(b - c)} + \frac{f(c)(\tau - a)(\tau - b)}{(c - a)(b - c)}$$

$$\tau^* = \frac{1}{2} \frac{f(a)(b^2 - c^2) + f(b)(c^2 - a^2) + f(c)(a^2 - b^2)}{f(a)(b - c) + f(b)(c - a) + f(c)(a - b)}$$

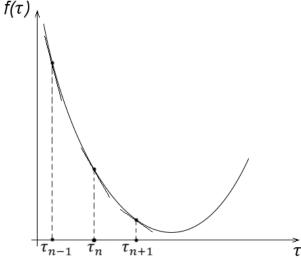

# Line search using derivatives

$$\tau_{n+1} = \tau_n - \gamma_n f'(t_n) \qquad \gamma_n > 0, \tau_0$$

$$\lim_{n\to\infty} \gamma_n = \gamma \qquad \qquad \sum_{n=0}^{\infty} \gamma_n = \infty$$

e.g. 
$$|\tau_{n+1} - \tau_n| < \varepsilon$$
 (STOP)

$$\tau_{1} = \tau_{0} - \gamma_{0} f'(\tau_{0}) 
\tau_{2} = \tau_{1} - \gamma_{1} f'(\tau_{1}) = \tau_{0} - \gamma_{0} f'(\tau_{0}) - \gamma_{1} f'(\tau_{1}) 
\tau_{3} = \tau_{1} - \gamma_{1} f'(\tau_{1}) = \tau_{0} - \gamma_{0} f'(\tau_{0}) - \gamma_{1} f'(\tau_{1}) 
f'(\tau_{0}) = \tau_{0} - \gamma_{0} f'(\tau_{0}) - \gamma_{1} f'(\tau_{1})$$

$$\tau_{n+1} = \tau_n + \gamma_n f'(\tau_n) = \dots = \tau_0 - \gamma_0 f'(\tau_0) - \gamma_1 f'(\tau_1) - \dots - \gamma_n f'(\tau_n)$$

$$|\tau_{n+1} - \tau_0| = |\sum_{k=0}^{\infty} \gamma_k f'(\tau_k)| \le \sum_{k=0}^{\infty} \gamma_k |f'(\tau_k)| \le \max_{0 \le k \le n} |f'(\tau_k)| \sum_{k=0}^{\infty} \gamma_k$$

$$| au_{\infty} - au_0| \leq \sum_{k=0}^{\gamma_k} \gamma_k = \infty$$

### Line search using sign of derivatives

$$\tau_{n+1} = \tau_n - \vartheta_n sign[f'(\tau_n)]$$

$$\gamma_n f'(\tau_n) = \gamma_n |f'(\tau_n)| * sign f'(\tau_n) = \vartheta_n sign[f'(\tau_n)], \text{ where } \vartheta_n = \gamma_n |f'(\tau_n)|$$

$$\vartheta_n > 0$$

$$\lim_{n \to \infty} \vartheta_n = 0$$
, because  $\lim_{n \to \infty} |f'(\tau_n)| = 0$ ,  $\lim_{n \to \infty} \gamma_n = \gamma$ 

$$\sum_{n=0}^{\infty} \vartheta_n = \infty \qquad \qquad \lim_{n \to \infty} \vartheta_n = \lim_{n \to \infty} \gamma_n |f'(\tau_n)| = 0$$

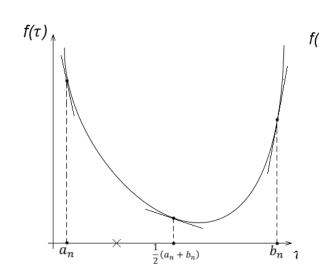

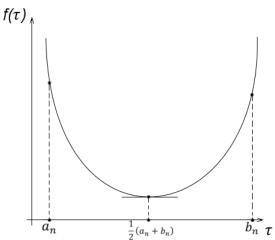

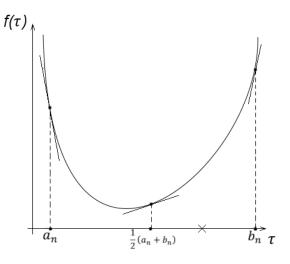

#### **Bolzano** method

 $sign a_n \neq sign b_n$ 

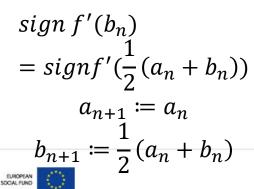

$$sign f'(a_n) = sign f'(\frac{1}{2}(a_n + b_n)) \quad f'\left(\frac{1}{2}(a_n + b_n)\right) = 0$$

$$a_{n+1} \coloneqq \frac{1}{2}(a_n + b_n) \qquad \qquad \tilde{\tau} \coloneqq \frac{1}{2}(a_n + b_n)$$

$$b_{n+1} \coloneqq b_n$$

$$f'\left(\frac{1}{2}(a_n + b_n)\right) = 0$$

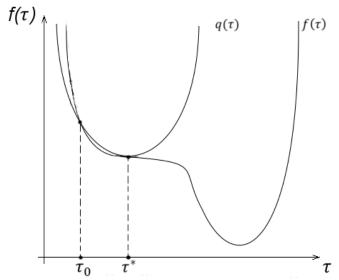

$$\tilde{\tau} \coloneqq \frac{1}{2}(a_n + b_n)$$

### Newton's method

$$\begin{aligned} &\tau_0 \\ &\tau_{n+1} = \tau_n - \frac{f'(\tau_n)}{f''(\tau_n)} \\ &|\tau_{n+1} - \tau_n| < \varepsilon \text{ (STOP)} \end{aligned}$$

$$f(\tau) = f(\tau_0) + (\tau - \tau_0)f'(\tau_0) + \frac{1}{2}(\tau - \tau_0)^2 f''(\tau_0) + 0_3(|\tau - \tau_0|)$$

$$q(\tau)$$

$$q'(\tau) = f'(\tau_0) + (\tau^* - \tau_0)f''(\tau_0) = 0$$

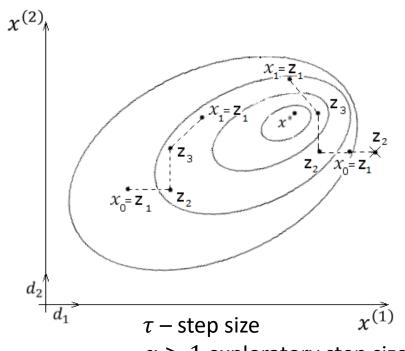

$$\tau^* = \tau_0 - \frac{f'(\tau_0)}{f''(\tau_0)}$$

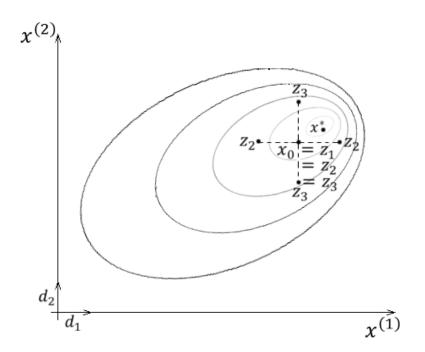

# Method of Hooke and Jevees with discrete steps

 $\alpha > 1$  exploratory step size  $\beta \in (0,1)$  acceleration factor  $\tau \coloneqq \tau \beta$ 

## Method of Rosenbrock with discrete

 $\tau$  – step size

 $\alpha > 1$  – exploratory step size acceleration

 $\beta \in (-1,0)$  – acceleration factor

$$\tau_s \coloneqq \tau_s \alpha$$

$$\tau_{\scriptscriptstyle S}\coloneqq \tau_{\scriptscriptstyle S}\beta$$

# Method of Hooke and Jeeves using line searches

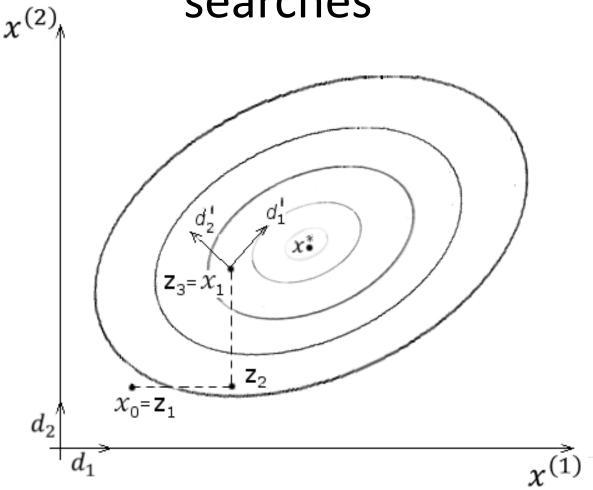

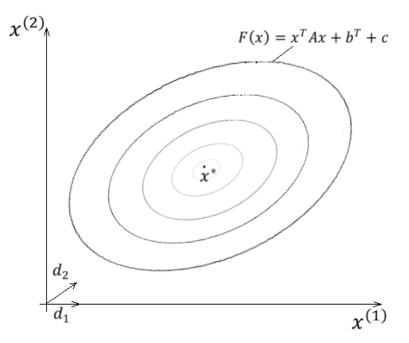

# Method of Rosenbrock using line searches

# Powell's method – conjugate directions

 $d_1, d_2, \dots, d_S$  - conjugated directions, A - symmetric, positively defined matrix

$$d_i^T A d_j = \begin{cases} 0 & i \neq j \\ & \\ 1 & i = j \end{cases}$$

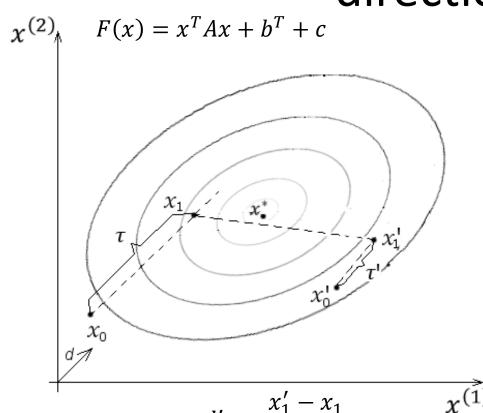

# Powell's method – conjugate directions

$$x_1 = x_0 + x^*d$$
 $\tau^*$  - optimal step size along the direction  $d$  from  $x_0$ 
 $x_1' = x_0' + \tau^{*'}d$ 
 $\tau^{*'}$  - optimal step size along the direction  $d$  from  $x_0'$ 

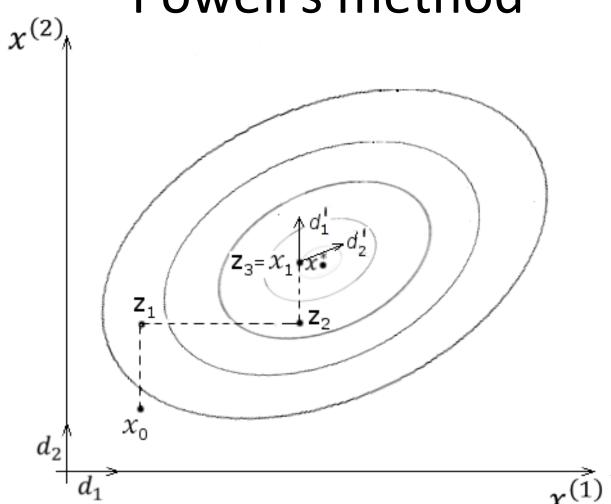

$$d^{T}Ad' = 0$$
  
 $d, d'$ - conjugated with respect  $A$ 

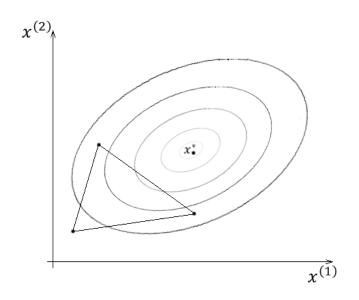

### Powell's method

#### Nelder-Mead method

 $x_1 x_2 \dots x_{S+1}$  - s-dimensional simplex

$$x_H \to F(x_H) = \max_{1 \le s \le S+1} F(x_S)$$

$$x_L \to F(x_L) = \min_{1 \le s \le S+1} F(x_S)$$

$$\bar{x} = \frac{1}{s} \sum_{S=1, S \ne H} x_S$$

Initial simplex:

$$x_0, c$$

$$d_i = [$$

$$a = \frac{c}{S\sqrt{2}}(\sqrt{S+1} + \sqrt{2} - 1)$$

$$b = \frac{c}{S\sqrt{2}}(\sqrt{S+1} - 1)$$

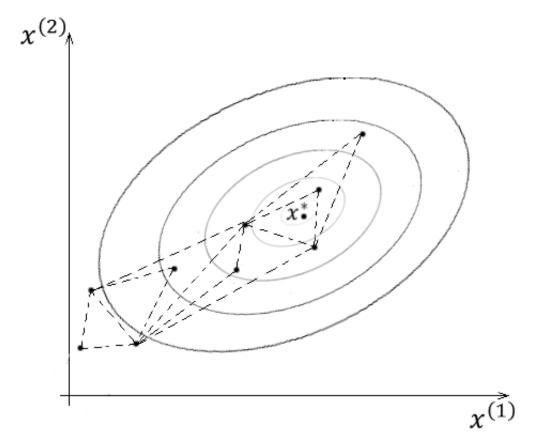

$$x_i = x_0 + d_i, x_{S+1} = x_0$$

#### Nelder-Mead method

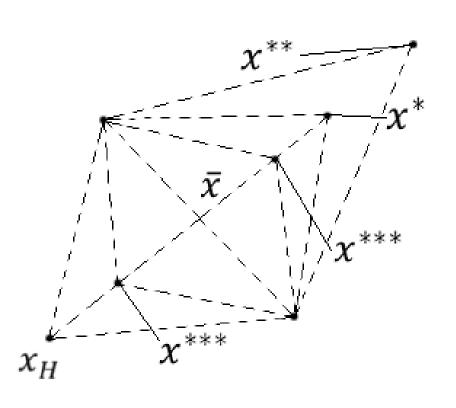

### Nelder-Mead method

#### Reflection

$$x^* = \bar{x} + \alpha(\bar{x} - x_H)$$

 $\alpha$  – reflection coefficient

If 
$$\alpha > 0$$

$$F(x^*) < F(x_L)$$

#### **Expansion**

$$x^{**} = \bar{x} + \gamma(x^* - \bar{x}) \qquad \gamma > 1$$

 $\gamma$  – expansion coefficient

If 
$$F(x^*) > F(x_H)$$

#### Contraction

$$x^{***} = \bar{x} + \beta(x_H - \bar{x})$$

If 
$$F(x^*) > \max_{1 \le S \le S+1} F(x_S)$$

$$x^{***} = \bar{x} + \beta(x^* - \bar{x}) \quad \beta \in (0, 1)$$

 $\beta$  – contraction coefficient

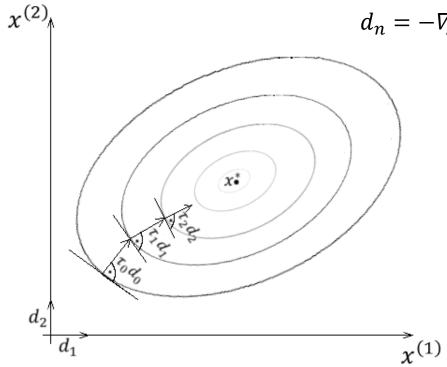

# The gradient descent method

$$x_{n+1} = x_n + \tau_n d_n$$

$$d_n = -\nabla_x F(x_n) ; \tau_n > 0, \lim_{n \to \infty} \tau_n = \tau, \sum_{n=0}^{\infty} \tau_n = \infty$$

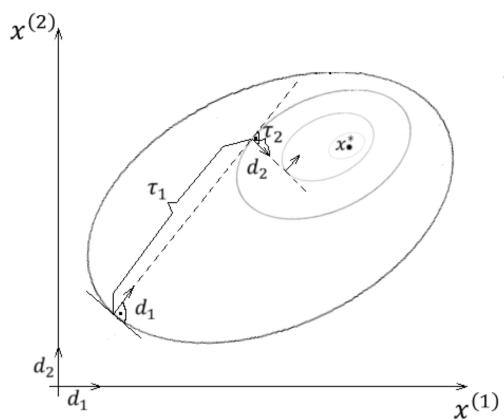

$$\|x_{n+1} - x_n\| = \|\tau_n d_n\| < \varepsilon$$

# The gradient descent method

$$x_{n+1} = x_n + \tau_n d_n$$
  $d_n = -\nabla_x F(x_n), \ \tau_n$  – optimal step size along the direction  $d_n$ 

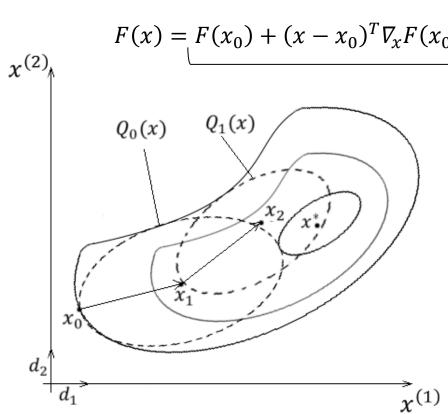

$$||x_{n+1} - x_n|| < \varepsilon$$

### Newton's method

$$F(x) = F(x_0) + (x - x_0)^T \nabla_x F(x_0) + \frac{1}{2} (x - x_0)^T H(x_0) (x - x_0) + 0_3 (\|x - x_0\|)$$

$$Q(x)$$

$$\nabla_{x}Q(x) = \nabla_{x}F(x_{0}) + H(x_{0})(x^{*} - x_{0}) = O_{S}$$

$$x^* = x_0 - H^{-1}(x_0) \nabla_{x} F(x_0)$$

$$x_{n+1} = x_n - H^{-1}(x_n) \nabla_{x} F(x_n)$$

#### Variable metric methods

Step 0: 
$$z_1 = x_0$$

$$d_1 = -D_1 \nabla_x F(z_1) \quad D_1 = I$$

Step 1: 
$$z_{s+1}=z_s+\tau_s d_s$$
  $\tau_s$  – optimal step size along the direction  $d_s$  If  $\|\tau_s d_s\|<\varepsilon$  (STOP)

otherwise go to 2

Step 2: 
$$d_{s+1} = -D_{s+1}\nabla_x F(z_{s+1})$$

$$D_{S+1} = D_S + \frac{p_S p_S^T}{p_S^T q_S} - \frac{D_S q_S q_S^T D_S}{q_S^T D_S q_S},$$

$$p_S = \tau_S d_S$$
,  $q_S = \nabla_{\chi} F(z_{S+1}) - \nabla_{\chi} F(z_S)$ 

$$s \coloneqq s + 1$$
, go to 1

$$D_{S+1} \approx H^{-1}(x_{S+1})$$

# Fletcher-Reeves method of conjugate gradients

Step 0: 
$$z_1 = x_0$$
,  $s = 1$ ,  $d_1 := -\nabla_x F(z_1)$ 

Step 1: 
$$z_{s+1} \coloneqq z_s + \tau_s d_s$$

 $au_{\scriptscriptstyle S} o$  optimal step size along the direction  $d_{\scriptscriptstyle S}$ 

If 
$$\|\tau_s d_s\| < \varepsilon$$
 (STOP)

otherwise go to 2

Step 2: 
$$d_{S+1}\coloneqq -\nabla_{\!\!\chi} F(z_{S+1}) + \frac{\|\nabla_{\!\!\chi} F(z_{S+1})\|}{\|\nabla_{\!\!\chi} F(z_{S})\|} d_{S}$$
  $s\coloneqq s+1$ , go to 1

 $d_1$ ,  $d_2$ , ...,  $d_S$  – conjugate directions

# Fletcher-Reeves method of conjugate gradients

Step 0: 
$$z_1 = x_0$$
,  $s = 1$ ,  $d_1 := -\nabla_x F(z_1)$ 

Step 1: 
$$z_{s+1} \coloneqq z_s + \tau_s d_s$$

 $au_{\scriptscriptstyle S} o$  optimal step size along the direction  $d_{\scriptscriptstyle S}$ 

If 
$$\|\tau_s d_s\| < \varepsilon$$
 (STOP)

otherwise go to 2

Step 2: 
$$d_{S+1}\coloneqq -\nabla_{\!\!\chi} F(z_{S+1}) + \frac{\|\nabla_{\!\!\chi} F(z_{S+1})\|}{\|\nabla_{\!\!\chi} F(z_{S})\|} d_{S}$$
  $s\coloneqq s+1$ , go to 1

 $d_1$ ,  $d_2$ , ...,  $d_S$  – conjugate directions

## Numerical constrained optimization methods

$$x^* \to F(x^*) = \min_{x \in \mathcal{D}_x} F(x)$$

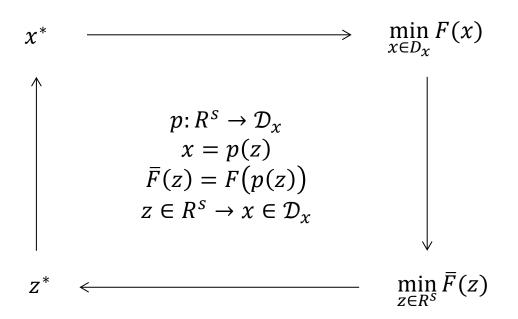

- 1. Elimination of constraints
- 2. Penalty function method
  - exterior penalty
  - barrier function
- 3. Methods of feasible directions
- 4. Other approaches

#### Elimination of constraints

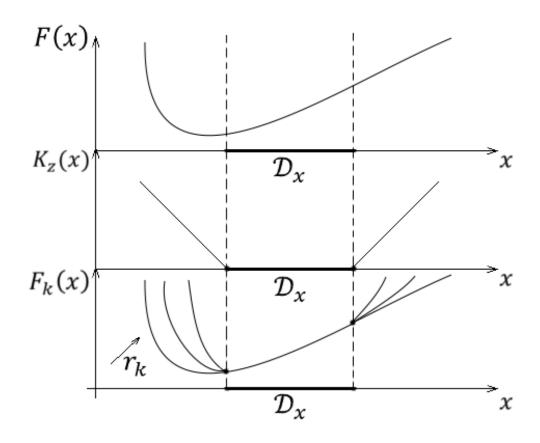

## Master programmes in English at Wrocław University of Technology

$$r_k > 0$$

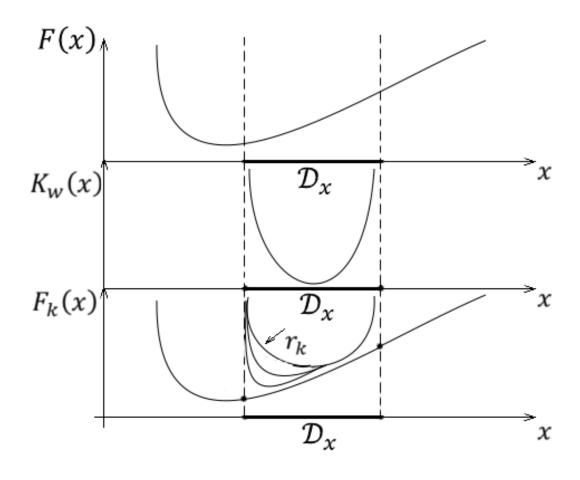

$$\lim_{k\to\infty} r_k = \infty$$

## Master programmes in English at Wrocław University of Technology

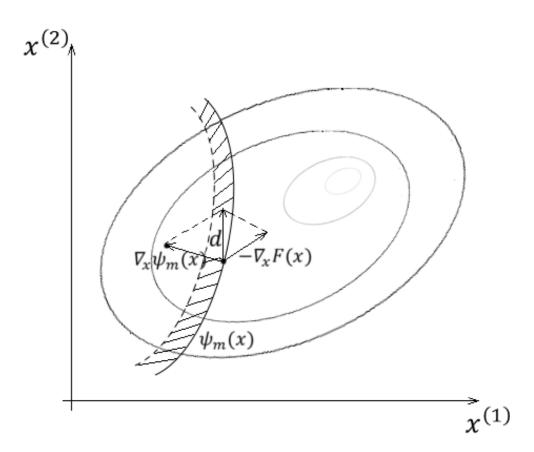

$$r_k > 0 \qquad \lim_{k \to \infty} r_k = 0$$

#### Feasible directions method

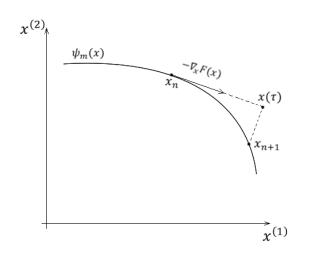

$$d = \frac{\nabla_x \psi_m(x)}{\|\nabla_x \psi_m(x)\|} - \frac{\nabla_x F(x)}{\|\nabla_x F(x)\|}$$
$$x : \psi(x) - \delta \le 0$$

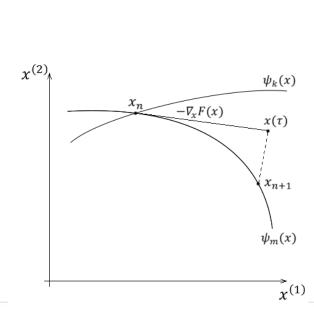

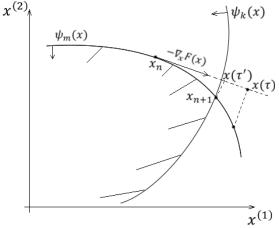

## Gradient projection method of Rosen

#### Random search - Down Hill method

Data:  $F(x), x_0, D_x, N$ 

Step 0:  $n=0, x^* = x_n$ 

Step 1: Generate point  $x_{n+1}$  in the set  $D_x$  with unity probability density

Step 2: IF  $F(x_{n+1}) < F(x^*)$  THEN  $x^* = x_{n+1}$ 

Step 3: IF n < N THEN n = n + 1 GO TO STEP 1

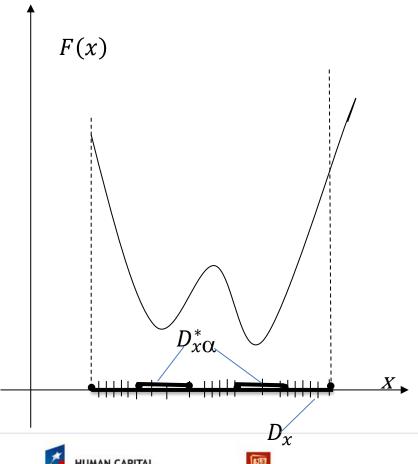

Step 4:  $x^* = x_N$ 

#### Random search

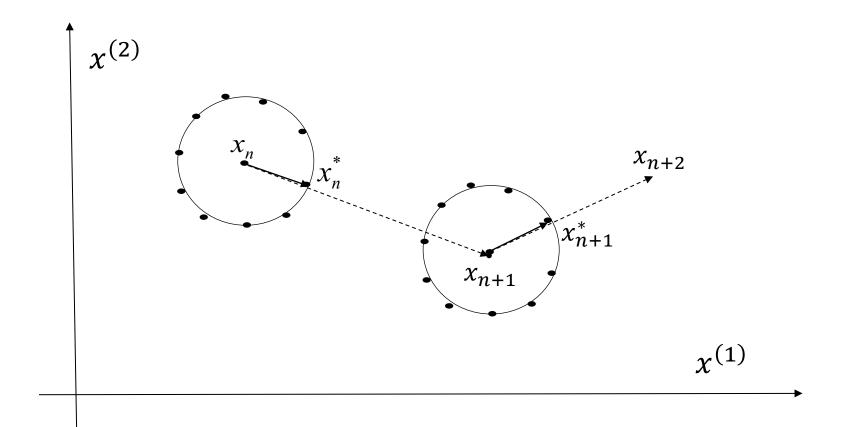

$$f(x) = \frac{F(x)}{\int\limits_{D_x} F(x) dx}$$

### General problem formulation

$$x^* \to F(x^*) = \min_{x \in \mathcal{D}_x} F(x)$$

$$\mathcal{D}_x = \{x \in R^s, \varphi_l(x) = 0, l = 1, 2, ..., L, \psi_m(x) \le 0, m = 1, 2, ..., M\}$$

$$F(x) = c^T x = \sum_{s=1}^{S} c_s x^{(s)}$$

$$\varphi_l(x) = a_l^T - b_l = \sum_{s=1}^S a_{ls} x^{(s)} - b_l = 0 \quad l = 1, 2, ..., L$$

$$\psi_m(x) = a_m^T x - b_m \le 0 = \sum_{s=1}^S a_{ms} x^{(s)} - b_m \le 0 \quad m = 1, 2, ..., M$$

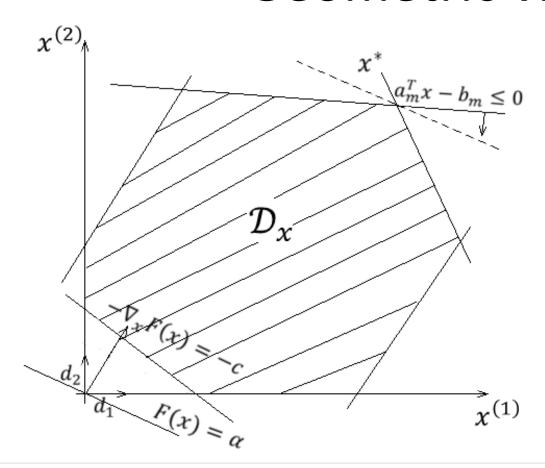

$$x^{(s)} \ge 0$$
  $s = 1, 2, ..., S$ 

#### Geometric view

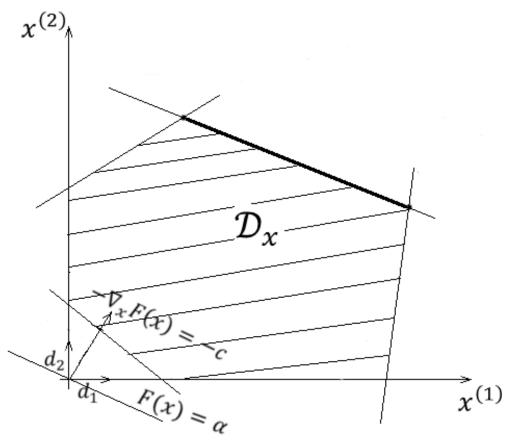

Solution is located on a vertex

#### Geometric view

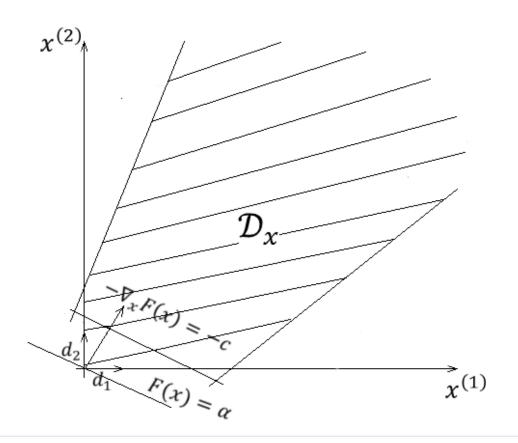

2. Solution is located on an edge

#### Geometric view

3. Unbounded solution

#### Standard form

$$F(x) = c^T x$$

A: 
$$\mathcal{D}_X = \{x \in R^s, Ax - b = 0_L, x \ge 0_S\}$$

or

B: 
$$\mathcal{D}_x = \{x \in R^s, Ax - b \le 0_L, x \ge 0_S\}$$

$$c = \begin{bmatrix} c_1 \\ \vdots \\ c_S \end{bmatrix}, \qquad b = \begin{bmatrix} b_1 \\ \vdots \\ b_L \end{bmatrix}, \qquad x = \begin{bmatrix} \chi^{(1)} \\ \vdots \\ \chi^{(S)} \end{bmatrix}, \qquad A_{SxL} = \begin{bmatrix} a_{11} & \cdots & a_{1S} \\ \vdots & \ddots & \vdots \\ a_{L1} & \cdots & a_{LS} \end{bmatrix}$$

## The simplex method

- Generation of initial basis
- 2. Checking  $c c_B B^{-1} A \ge 0_S$ . If it holds, then  $x_B$  is basic feasible solution  $x = [x_B \ 0]$
- 3. Such a k that  $c_k z_k = \min_{1 \le s \le S} (c_s z_s)$  is introduced to the basis
- 4. Checking, whether  $h_k \leq 0$ , if it holds true solution is unbounded
- 5. Removing such / from the basis, for which:

$$\frac{h_{l0}}{h_{lk}} = \min_{1 \le s \le S} \{ \frac{h_{s0}}{h_{sk}}, h_{sk} > 0 \}$$

6.  $I_B \coloneqq I_B \setminus \{l\} \cup \{k\}$   $I_B = \{j \in \{1, 2, ..., S\} \quad x^{(j)} \text{ belongs to the basis } \}$

$$s = 1, 2, ..., S \qquad i = 0, 1, ..., S$$

$$s \in I_B \setminus \{l\}$$

## Quadratic programming

$$x^* \to F(x^*) = \min_{x \in \mathcal{D}_x} F(x)$$

$$F(x) = x^T D x + c^T x$$

$$D_x = \{x \in R^s, Ax = b, x \ge 0\}$$

#### Linear Fractional Programming

$$x^* \to F(x^*) = \min_{x \in \mathcal{D}_x} F(x)$$

$$F(x) = \frac{a^{T}x + b}{c^{T}x + d} \qquad a \in \mathcal{R}^{S}, b \in \mathcal{R}, c \in \mathcal{R}^{S}, d \in \mathcal{R}$$
$$c^{T}x + d \neq 0$$

$$\mathcal{D}_{x} = \{x \in R^{s}, Ax - e \leq 0_{L}, x \geq 0_{S}\}$$

**Charnes - Cooper Method** 

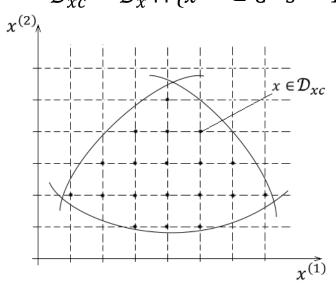

## Discrete programming – branch and bound method

$$x^* \to F(x^*) = \min_{x \in \mathcal{D}_{xc}} F(x)$$

 $\mathcal{D}_{xc} = \mathcal{D}_x \cap \{x^{(s)} \subset C \mid s = 1, 2, ..., S\}$  integer decision variables

#### Special case

 $\mathcal{D}_{xc} = \{x_1, x_2, \dots, x_k\}$  – finite set, k – large number

 $\mathcal{D}_{xc} = \{0, 1\}$  - binary programming

## Master programmes in English at Wrocław University of Technology

Step 0: 
$$\mathcal{D}_0 = \{\mathcal{D}_{xc} = \mathcal{D}_{01}\}, n = 0, J_0 = 1$$

Step 1: Determine a set 
$$\mathcal{D}^* \in \mathcal{D}_n$$
  
$$\mathcal{F}(\mathcal{D}^*) = \min_{\mathcal{D} \in \mathcal{D}_n} \mathcal{F}(\mathcal{D})$$

Step 2: Checking whether  $\mathcal{D}^*$  is a set ?  $(\{x^*\} = \mathcal{D}^*)$  or  $x^* \sim \mathcal{F}(\mathcal{D}^*)$  i.e.  $\mathcal{F}(\mathcal{D}^*) = F(x^*)$   $x^* \in \mathcal{D}^*$  (?) then  $x^*$  optimal solution STOP

Step 3:  $\mathcal{D}^* = \mathcal{D}_{nk}$  is split up into M disjoint sets

$$\mathcal{D}_{1nk}\mathcal{D}_{2nk}\dots\mathcal{D}_{Mnk} \quad \mathcal{D}_{nk} = \bigcup_{m=1}^{M} \mathcal{D}_{mnk}$$

Step 4: 
$$\mathcal{D}^* = \mathcal{D}_{nk}$$

$$\mathcal{D}_{n+1} = \mathcal{D}_n \cup \{\mathcal{D}_{1nk}, \mathcal{D}_{2nk}, \dots, \mathcal{D}_{Mnk}\} \backslash \mathcal{D}_{nk}$$

$$\mathcal{D}_{n+1,j} = \mathcal{D}_{nj}$$
  $j = 1, 2, ..., k-1$ 

$$\mathcal{D}_{n+1,j} = \mathcal{D}_{mnk} \quad j = k+m, m = 1, 2, \dots, M$$

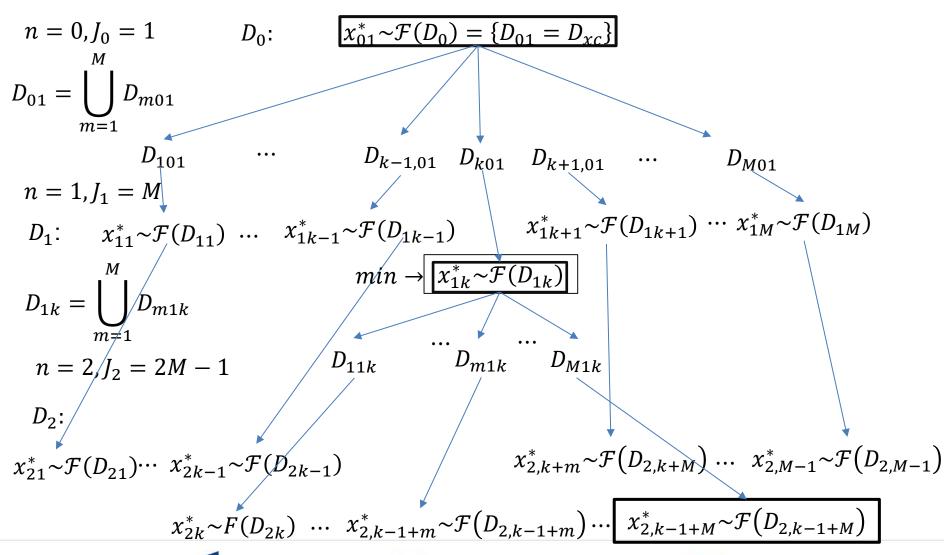

$$\mathcal{D}_{n+1,j} = \mathcal{D}_{ni}$$
  $j = k + M + i, i = k + 1, ..., J_n, J_{n+1} = J_n + M - 1$ 

## Master programmes in English at Wrocław University of Technology

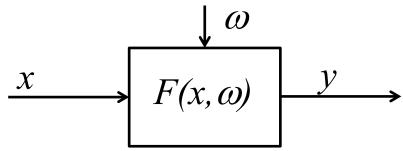

#### Decision making under uncertainty

$$F(x) = E_{\omega}[F(x,\underline{\omega})]$$

$$\mathcal{Q}_{x} = E[\mathcal{Q}_{x}(\underline{\omega})] =$$

$$F(x) = E[F(x, \underline{\omega})]$$

$$\mathcal{D}_{x} = E[\mathcal{D}_{x}(\underline{\omega})] = \begin{cases} x \in \mathcal{R}^{S}; E[\varphi_{l}(x, \underline{\omega})] = 0, l = 1, ..., L, E[\psi_{m}(x, \underline{\omega})] \leq 0, m = 1, ..., M \end{cases}$$

$$x^* \to F(x^*) = \min_{x \in D_x} F(x)$$

#### A game against nature

 $\mathcal{Q}_i$  - the minimum profit for *i*—th row

 $A_i$  - the maximum profit for *i*–th row

$$H_i(\gamma) = a_i \gamma + A_i(1-\gamma) \quad \gamma \in [0,1]$$

#### The Hurwitz rule.

Analyzing the subsequent rows of the matrix we find the minimum and the maximum revenue, i.e. values  $a_i$ ,  $A_i$  and value of the function  $H_i(\gamma)$  for a given  $\gamma$ . We make such a decision, for which the value of the function  $H_i(\gamma)$  is the greatest. In case of ambiguity, we recommend all the decisions for which the above condition is satisfied.

| Type of | We      | ather conditi | ons  | а   | A   | $H(\gamma)$    |       |
|---------|---------|---------------|------|-----|-----|----------------|-------|
| corn    | drought | normal        | rain | min | max | $\gamma = 0.5$ |       |
| 1       | 8       | 10            | 12   | 8   | 12  | 10             |       |
| 2       | 10      | 11            | 7    | 7   | 11  | 9              |       |
| 3       | 9       | 13            | 8    | 8   | 13  | 10.5           | ← max |
| 4       | 11      | 10            | 6    | 6   | 11  | 8.5            |       |
| 5       | 10      | 10            | γ 9  | 9   | 10  | 9.5            |       |

### Two-person zero-sum game

Two-player zero-sum game Payoff matrix of player A:

| A     | $B_1$    | $B_2$    |     | $B_m$    |     | $B_{M}$  |
|-------|----------|----------|-----|----------|-----|----------|
| $A_1$ | $a_{11}$ | $a_{12}$ |     | $a_{1m}$ |     | $a_{1M}$ |
| $A_2$ | $a_{21}$ | $a_{22}$ |     | $a_{2m}$ |     | $a_{2M}$ |
|       |          |          | ••• |          | ••• |          |
| $A_n$ | $a_{n1}$ | $a_{n2}$ | ••• | $a_{nm}$ | ••• | $a_{nM}$ |
|       |          |          | ••• |          | ••• |          |
| $A_N$ | $a_{N1}$ | $a_{N2}$ |     | $a_{Nm}$ |     | $a_{NM}$ |

Payoff matrix of player B:

| A     | $B_1$     | $B_2$     |     | $B_m$     | ••• | $B_M$     |
|-------|-----------|-----------|-----|-----------|-----|-----------|
| $A_1$ | $-a_{11}$ | $-a_{12}$ |     | $-a_{1m}$ |     | $-a_{1M}$ |
| $A_2$ | $-a_{21}$ | $-a_{22}$ |     | $-a_{2m}$ |     | $-a_{2M}$ |
|       |           |           |     |           |     |           |
| $A_n$ | $-a_{n1}$ | $-a_{n2}$ |     | $-a_{nm}$ |     | $-a_{nM}$ |
|       | •••       |           |     |           | ••• | •••       |
| $A_N$ | $-a_{N1}$ | $-a_{N2}$ | ••• | $-a_{Nm}$ |     | $-a_{NM}$ |

Player A aims to maximize revenue

Player B aims to minimize losses

Usually the payoff matrix of player A is presented

## Decision making using game theory

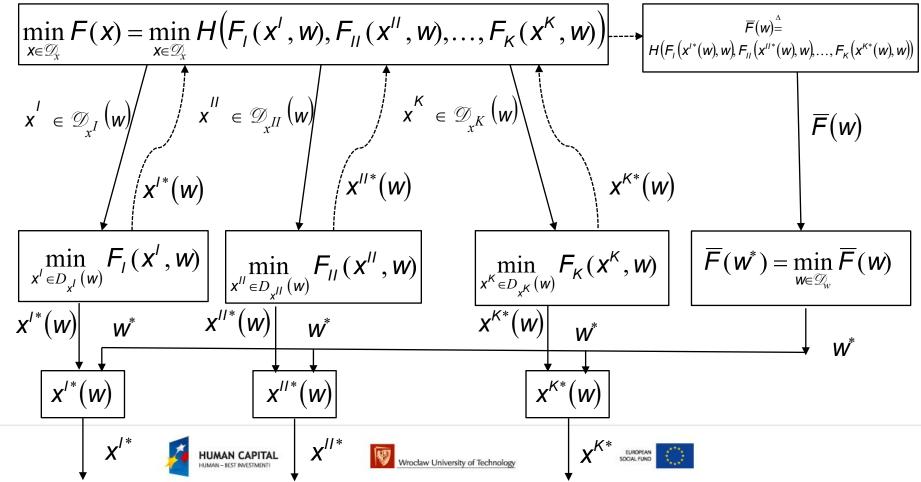

- Typical approaches to game solving
  - determination of saddle point
  - removal of dominated strategies
  - determination of mixed strategies for:
    - N=2 and M=2
    - N>2 and M>2

## Separable goal function and separable constrains with coordinate variable

#### Multistage optimization

Step 1. 
$$x_S^* = G_S(x_1, ..., x_{S-1}) \rightarrow F_S(x_1, x_2, ..., x_S^*) = \min_{x_S \in \mathcal{D}_{xS}} F_S(x_1, x_2, ..., x_S)$$

The value of the goal function in the optimal solution:

$$F_{S-1}(x_1, x_2, \dots, x_{S-1}) \stackrel{\triangle}{=} F_S(x_1, x_2, \dots, x_S^*) = F_S(x_1, x_2, \dots, G_S(x_1, \dots, x_{S-1}))$$

Constraints in the optimal solution:

$$\mathcal{D}_{xS-1}(x_{1},...,x_{S-1})^{\Delta} = \mathcal{D}_{xS}(x_{1},...,x_{S-1},x_{S}^{*} = G_{S}(x_{1},...,x_{S-1})) =$$

$$\begin{cases} [x_{1} \ x_{2} \cdots x_{S-1}]^{T} \in \mathcal{R}^{S-1} : \\ \varphi_{lS}(x_{1},x_{2},\cdots,G_{S}(x_{1},...,x_{S-1})) = \varphi_{lS-1}(x_{1},x_{2},\cdots,x_{S-1}) = 0, l = 1,2,...,L, \\ \psi_{mS}(x_{1},x_{2},\cdots,G_{S}(x_{1},...,x_{S-1})) = \psi_{mS-1}(x_{1},x_{2},\cdots,x_{S-1}) \leq 0, m = 1,2,...,M \end{cases}$$

#### Multistage optimization

Step 2. 
$$x_{S-1}^* = G_{S-1}(x_1, ..., x_{S-2}) \rightarrow F_{S-1}(x_1, x_2, ..., x_{S-1}^*) = \min_{x_{S-1} \in \mathcal{D}_{x_{S-1}}} F_{S-1}(x_1, x_2, ..., x_{S-1})$$

The value of the goal function in the optimal solution:

$$F_{S-2}(x_1, x_2, \dots, x_{S-2}) \stackrel{\triangle}{=} F_{S-1}(x_1, x_2, \dots, x_{S-1}^*) = F_{S-1}(x_1, x_2, \dots, G_{S-1}(x_1, \dots, x_{S-2}))$$

Constraints in the optimal solution:

$$\mathcal{D}_{xS-2}(x_{1},...,x_{S-2}) \stackrel{\triangle}{=} \mathcal{D}_{xS-1}(x_{1},...,x_{S-2},x_{S-1}^{*} = G_{S-1}(x_{1},...,x_{S-2})) =$$

$$\begin{cases} [x_{1} \ x_{2} \cdots x_{S-2}]^{T} \in \mathcal{R}^{S-2} : \\ \varphi_{lS-1}(x_{1},x_{2},\cdots,G_{S-1}(x_{1},...,x_{S-2})) = \varphi_{lS-2}(x_{1},x_{2},\cdots,x_{S-2}) = 0, l = 1,2,...,L, \\ \psi_{mS-1}(x_{1},x_{2},\cdots,G_{S-1}(x_{1},...,x_{S-2})) = \psi_{mS-2}(x_{1},x_{2},\cdots,x_{S-2}) \leq 0, m = 1,2,...,M \end{cases}$$

#### Multistage optimization

Step S-1. 
$$x_1^* \to F_1(x_1^*) = \min_{x_1 \in \mathcal{D}_{r_1}} F_1(x_1)$$

We may now return to expressions "G" determined in the previous steps

$$x_1^*$$

$$x_2^* = G_2(x_1^*)$$

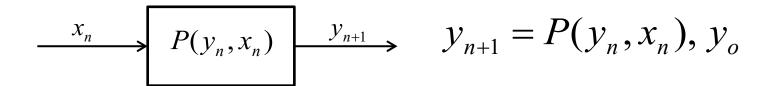

$$x_{S-1}^* = G_{S-1}(x_1^*, x_2^*, \dots, x_{S-1}^*)$$

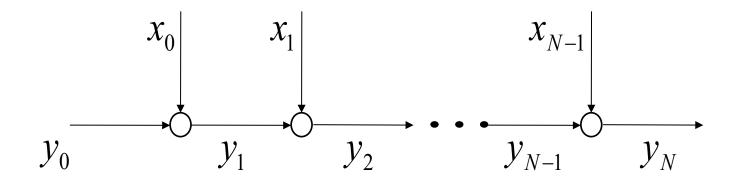

$$x_{S}^{*} = G_{S}(x_{1}^{*}, x^{*}, \dots, x_{S-1}^{*})$$

$$Q(x_0, x_1, \dots, x_{N-1}, y_1, y_2, \dots, y_N) = \sum_{n=0}^{N-1} A_{n+1}(x_n, y_{n+1}) \stackrel{\triangle}{=} F(y_0, x_0, x_1, \dots, x_{N-1})$$

#### Dynamic programming

Step 2. 
$$x_{N-2}^* \to \min_{x_{N-2}} \{ A_{N-1}(x_{N-2}, y_{N-1}) + V_{N-1}(y_{N-1}) \}$$

We know, that  $y_{N-1} = P(y_{N-2}, x_{N-2})$ 

$$x_{N-2}^* = G_{N-2}(y_{N-2}) \rightarrow \min_{x_{N-2}} \{A_{N-1}(x_{N-2}, P(y_{N-2}, x_{N-2})) + V_{N-1}(P(y_{N-2}, x_{N-2}))\}$$

$$\begin{split} &V_{N-2}(y_{N-2}) \stackrel{\Delta}{=} \min_{x_{N-2}} \left\{ A_{N-1}(x_{N-2}, P(y_{N-2}, x_{N-2})) + V_{N-1}(P(y_{N-2}, x_{N-2})) \right\} = \\ &= \left\{ A_{N-1}(x_{N-2}^*, P(y_{N-2}, x_{N-2}^*)) + V_{N-1}(P(y_{N-2}, x_{N-2}^*)) \right\} = \\ &= A_{N-1}(G_{N-2}(y_{N-2}), P(y_{N-2}, G_{N-2}(y_{N-2}))) + V_{N-1}(P(y_{N-2}, G_{N-2}(y_{N-2}))) \end{split}$$

#### Dynamic programming

Step N.

Step N. 
$$x_0^* \to \min_{x_0} \{A_1(x_0, y_1) + V_1(y_1)\}$$
We know, that  $y_1 = P(y_0, x_0)$ 

$$x_0^* = G_0(y_0) \to \min_{x_0} \{A_1(x_0, P(y_0, x_0)) + V_1(P(y_0, x_0))\}$$

 $y_0$  is known and from now on successive decisions may be determined

$$x_{0}^{*}, x_{1}^{*}, \dots, x_{N-1}^{*}, \qquad x_{0}^{*} = G_{0}(y_{0}) \to y_{1} = P(y_{0}, x_{0}^{*})$$

$$x_{1}^{*} = G_{1}(y_{1}) \to y_{2} = P(y_{2}, x_{2}^{*})$$

$$\vdots$$

$$x_{N-2}^{*} = G_{N-2}(y_{N-2}) \to y_{N-1} = P(y_{N-2}, x_{N-2}^{*})$$

$$x_{N-1}^{*} = G_{N-1}(y_{N-1}) \to y_{N} = P(y_{N-1}, x_{N-1}^{*})$$

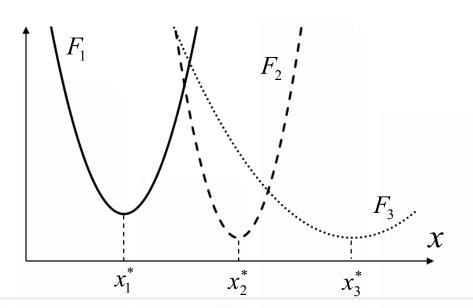

x – decision variables vector

$$F_1(x), F_2(x), \dots, F_K(x)$$
 – performance indices

#### **Synthetic performance index**

$$F(x) = H(F_1(x), F_2(x), ..., F_K(x))$$

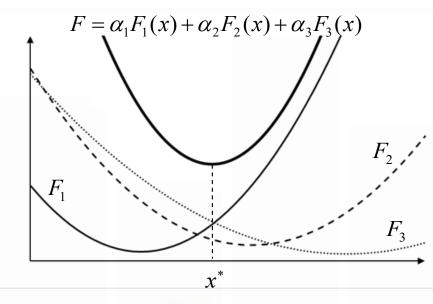

e. g.: 
$$F(x) = \sum_{k=1}^{K} \alpha_k F_k(x)$$

where:  $\sum_{k=1}^{K} \alpha_k = 1$ ,  $\alpha_k > 0$ , k = 1, 2, ..., K

$$F(x) = \prod_{k=1}^{K} F_k(x)$$

$$x^* \to F(x^*) = \min_{x \in \mathcal{D}_x} F(x)$$

H(.) – monotonic for all variables

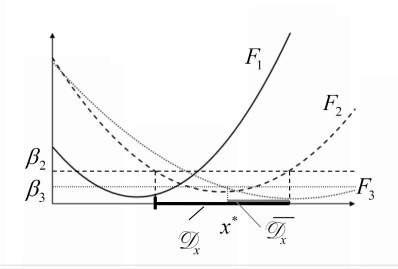

A selected performance index is optimized, Upper limits for values of another performance indices are specified.

Let  $F_1(x)$  be a selected performance index

$$F_{k}(x) \le \beta_{k}, \quad k = 2, 3, ..., K$$

Requirements for performance indices are met

$$\overline{\mathcal{D}_x} = \mathcal{D}_x \cap \left\{ x \in \mathcal{R}^S : F_k(x) \le \beta_k, \ k = 2, \dots, K \right\}$$
$$x^* \to F_1(x^*) = \min_{x \in \overline{\mathcal{D}_x}} F_1(x)$$

Ranked/prioritized performance indices

$$F_1(x) \succ F_2(x) \succ \dots \succ F_K(x) \quad x \in \mathcal{D}_x$$

Step 1. 
$$\mathscr{Q}_{x1} = \mathscr{Q}_x$$

$$x_1^* \to F_1(x_1^*) = \min_{x \in \mathcal{D}_{-1}} F_1(x)$$

Step 2. 
$$\mathscr{D}_{x2} = \mathscr{D}_{x1} \cap \left\{ x \in \mathscr{R}^S : F_1(x) \leq F_1(x_1^*) + \gamma_1 \right\}$$

$$x_2^* \to F_2(x_2^*) = \min_{x \in \mathcal{D}_{x2}} F_2(x)$$

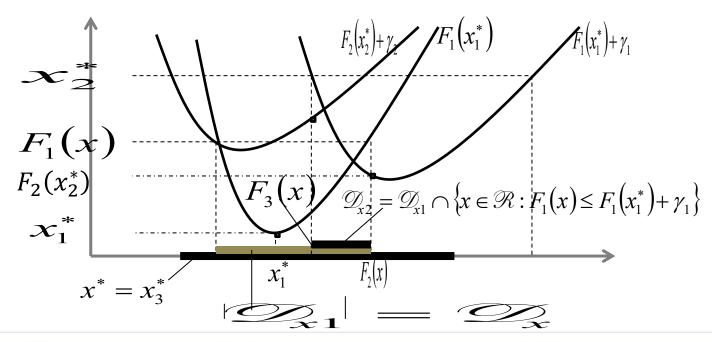

Step K. 
$$\mathscr{Q}_{xK} = \mathscr{Q}_{xK-1} \cap \left\{ x \in \mathscr{R}^S : F_{K-1}(x) \leq F_1(x_{K-1}^*) + \gamma_{K-1} \right\}$$

$$x_K^* = x_K^* \to F_K(x_K^*) = \min_{x \in \mathscr{Q}_{xK}} F_K(x)$$

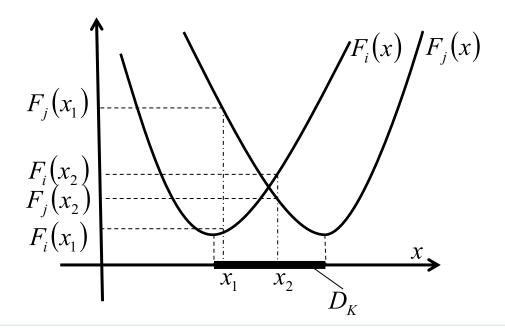

#### Non-dominated solutions

$$x_1, x_2 \in D_K \Leftrightarrow \forall j \in \{1, 2, ..., K\} \exists i \in \{1, 2, ..., K\}$$
  
 $F_j(x_1) > F_j(x_2) \Rightarrow F_i(x_1) < F_i(x_2)$ 

#### Exam

- Term 0: 23.06.2025. (Monday)
   room D 3.1, building C-16, time: 9<sup>15</sup>-11<sup>00</sup>
- Term 1: 7.07. 2025. (Monday)
   room D 3.1, building C-16, time: 9<sup>15</sup>-11<sup>00</sup>
- Term 2: 14.07. 2025. (Monday)
   room D 3.1, building C-16, time: 9<sup>15</sup>-11<sup>00</sup>

## Term "zero"- necessary conditions

- Positive grades from practice (classes) and laboratory
   i.e. ≥3.0 not later then "zero" term
- Final grade proposition mean value integer number i.e.:
- Final grade =  $\frac{[practice\ (classes) + laboratory]}{2} \ge 3.5$
- Must be present during "zero" term (otherwise reject bonus)

- About marks from this semester I will be informed by my assistants.
- About marks from previous years you must inform me by mail sending positive mark form JSOS (USOS) system with name of teacher, name of student and index number.

## Thank you for attention
